

Webinar Q/A

Using Integrated Windows Authentication with Websense Content Gateway, v7.6

August 17, 2011

1) Why is it necessary to use the port 88?

Port 88 is used for administrative security implementation of Kerberos.

2) Most of my users are part of a domain, but I also have a small community of users connecting that are not part of the domain. Is there a way to support both of these user communities when IWA is configured?

Users who are not part of the domain cannot be authenticated via IWA. You can apply IP or network based policies for users who are not a part of the domain.

3) Can you set realm by AD OU group/domain?

No. This is not possible. You can only setup multiple realms based on domain names.

4) So, what happens if I use domain admin to integrate to our AD and then degrade the rights of the user, the connection will lose?

If the proxy restarts it will try to join the domain again and will fail at this point. So it is not a good idea to degrade the account permissions. You must leave it on the same permissions permanently.
